Fermat's Last Theorem, first formulated by Pierre de Fermat in the seventeenth century, is the assertion that the equation $x^n + y^n = z^n$ has no solutions in positive integers for $n > 2$ Fermat proved his claim for $n = 4$, proven via Jean-Pierre Serre's epsilon conjecture by Kenneth Ribet in 1986 Hence,

Variations on a theorem of Abel - Institute for Advanced Study

Variations on a Theorem of Abel 323 of which will be discussed in this paper More importantly, the informal understanding seems to have been that the presence of global functional relations or addition theorems (loosely interpreted) was a widespread phenomenon in algebraic geometry, and one should usually expect at least some among them to yield precise

Duality in the flat cohomology of curves

9 by Springer-Verlag 1976 Duality in the Flat Cohomology of Curves M Artin (Cambridge, Mass)* and JS Milne (Ann Arbor, Mich)* To Jean-Pierre Serre groups, and then to apply Serre duality It may be worthwhile to begin by considering the two cases $A = \sim p$ and $A = \sim p$ There are canonical exact sequences of group schemes
